

Burns

Testimonial #: 107

February 8, 2003

Dear Herb:

One day while cooking, I absent-mindedly reached into the oven to retrieve a pan, forgetting that the broiler was on. My thumb received a searing burn and, to make things worse, I then grabbed the handle of the pan and burned my hand. I immediately applied ice to both areas, cursing my carelessness. Then I remembered Immunocal Skin Perfecting Cream and immediately applied it generously. Within a few minutes the burn was soothed and it healed so quickly I couldn't believe it! There are no scars either. There's magic in that stuff! It's been about one week since this happened and there is no sign at all that I was burned. I did apply the cream several times that first day but none after that.

Irene Moore

Skin Perfecting Cream for Burns Testimonial # 108

"The cord of my curling iron caught on the corner of my vanity while I was curling my hair jerking it from my hand. In the instant that it took for the curling iron to fall to the floor, the barrel of it caught the side of my face and also my neck, burning them severely. Each burn was approximately two inches long and an inch wide. The first thing I saw was the Immunocal Skin Perfecting Cream and quickly applied it to the burns. Immediately the excruciating burning sensation subsided. I continued to apply the cream in the morning and evening. The pain never returned and I have no scarring whatsoever. I praise God for Immunotec and its fine products." Sincerely, **Bobbie Jo Sims** December 28, 2001

Immunotec's Skin Perfecting Cream: 109

Immunotec's Skin Perfecting Cream, 10% active ingredient for healing is Immunocal! It is a safe and very effective skin cream. Protopic is a topical treatment for eczema that may cause stinging, burning and an increased risk of skin infections (according to the Protopic web site). As someone who copes with eczema (a common inflammatory skin condition accompanied by rashes and itching) the prospect of adding stinging and burning is not very inviting, to say the least. And you have to wonder: If a topical treatment stings, burns and infects some patients, maybe that's a red flag that something is not quite right. Last week the FDA issued a public health advisory to inform consumers that the use of two topical eczema creams - Protopic and Elidel - may pose a cancer risk. Both of these products address eczema by suppressing the immune system. (Talk about a red flag!) The FDA advisory is based on animal studies that revealed the cancer risk. Human studies may take more than a decade to confirm or disprove a similar risk among us non-lab animals. Product packaging for Protopic and Elidel will be required to carry a black box warning about the potential cancer danger, and consumers will be advised to use these products on a short-term basis. Meanwhile, before eczema patients apply a cream that may cause cancer, they might want to try a natural alternative that doesn't sting, burn, infect, or suppress the immune system and that of course is our Immunocal cream.
