

What is Cancer?

What is Cancer? There are many theories out there which attempt to make sense of why a cancer is produced in the body. Here are just a few examples:

Tissue acidity

Oxygen deprivation

Immune deficiency

Genetic predisposition

Malnutrition

Toxic accumulations

Stress of the body and/or psyche

Infectious microbes

No doubt that any of these can contribute to what can be called the "allostatic load". A human being is a biological system which is subject to carrying various physiological burdens which create a weakened state and thus increased tendency toward imbalance.

The most impressive model of understanding about cancer and most other disease that we have discovered is that of Geerd Hamer (MD) of Germany. His ideas are absolutely revolutionary regarding the nature of cancer and provide an opportunity for each of those afflicted to recontextualize their cancer experience and optimize their recovery.

In the Spring of 2006, we set out to prove that Dr. Hamer's assertions regarding cancer (and most other disease) were incorrect. After having received some initial training and applying these concepts to our patients for several months we were confronted with an abundant amount of empirical evidence supporting Hamer's ideas. Our most basic assumptions regarding cancer had been incorrect! This paradigm turns conventional medicine and even much of alternative medicine on its head, but once an understanding of the process is grasped, it points the way in terms of choosing various diagnostic or therapeutic interventions.

Combining Hamer's theory with that of Recall Healing™, our Doctors are discovering a distinct link between disease and the mind. Yet one more cog in the wheel of understanding the human body and it's ability to create dysfunction or heal.
